

What is a Sustainable Modular Building?

Can a modular building be a sustainable building? The short answer is a resounding yes!

As an owner purchasing modular buildings and prefabricated buildings, you have unlimited choices in construction methods and building materials.

By selecting a leader, such as Modular Solutions, in the sustainable movement you are making a conscious choice to go with a firm that has the experience and knowledge of how to construct a modular building that is good for the environment, and that will have an extended lifecycle.

You may ask "what goes into a sustainable modular building?" Modular buildings can implement any environmentally friendly product into the fabrication that you choose.

Sample choices might include bamboo floor covering, earth friendly paint without VOC's, and wall covering. You may select a green roof or a white reflective roof covering to reduce the heat omissions. You may also include energy star rated efficient appliances, fixtures, and products in the building package. Your modular building may include an upgrade insulation and recycled content product package. Solar designs have been incorporated into many designs.

It is important that you understand that there is a difference, and small choices can result in a more efficient and sustainable building.
